

# Cervical Cancer Screening (CCS-E)

## \*Electronic Clinical Data Systems (ECDS) Measure

### Measure Description

The percentage of women 21–64 years of age who were screened for cervical cancer using any of the following criteria:

- Women 21–64 years of age who had cervical cytology performed within the last 3 years.
- Women 30–64 years of age who had cervical high-risk human papillomavirus (hrHPV) testing performed within the last 5 years.
- Women 30–64 years of age who had cervical cytology/high-risk human papillomavirus (hrHPV) cotesting within the last 5 years.

### Numerator Compliance

The number of women who were screened for cervical cancer.

Either of the following meets criteria:

- Women 24–64 years of age as of December 31 of the measurement year who had cervical cytology during the measurement year or the 2 years prior to the measurement year.
- Women 30–64 years of age as of December 31 of the measurement year who had cervical high-risk human papillomavirus (hrHPV) testing during the measurement year or the 4 years prior to the measurement year and who were 30 years or older on the date of the test.

*NOTE: Evidence of hrHPV testing within the last 5 years also captures patients who had cotesting; therefore, additional methods to identify cotesting are not necessary.*

## Best Practices

- ★ **Assess** existing barriers to regular cervical cancer screening (i.e., access to care, cost, fear).
- ★ **Educate** the members about the importance of early detection and encourage screening.
- ★ **Request** to have cervical cytology results sent to you if done at an OB/GYN office.
- ★ **Set** care gap “alerts” in your electronic medical record.
- ★ **Document** the month, year, and results of most recent cervical cancer screening in the medical record.
