

Cervical Cancer Screening (CCS-E)

*Electronic Clinical Data Systems (ECDS) Measure Measure Description

Assesses percentage of members 21–64 years of age who were recommended for routine cervical cancer screening and were screened for cervical cancer using any of the following criteria:

- Members 21–64 years of age who were recommended for routine cervical cancer screening and had cervical cytology performed within the last 3 years.
- Members 30–64 years of age who were recommended for routine cervical cancer screening and had cervical high-risk human papillomavirus (hrHPV) testing performed within the last 5 years.
- Members 30–64 years of age who were recommended for routine cervical cancer screening and had cervical cytology/high-risk human papillomavirus (hrHPV) cotesting within the last 5 years

Numerator Compliance

The number of members who were screened for cervical cancer. Either of the following meets criteria:

- Members 24–64 years of age as of December 31 of the measurement year who had cervical cytology during the measurement year or the 2 years prior to the measurement year.
- Members 30–64 years of age as of December 31 of the measurement year who had cervical high-risk human papillomavirus (hrHPV) testing during the measurement year or the 4 years prior to the measurement year and who were 30 years or older on the date of the test.

NOTE: Evidence of hrHPV testing within the last 5 years also captures patients who had cotesting; therefore, additional methods to identify cotesting are not necessary.

Best Practices

- ★ **Assess** existing barriers to regular cervical cancer screening (i.e., access to care, cost, fear).
- ★ **Educate** the members about the importance of early detection and encourage screening.
- ★ **Request** to have cervical cytology results sent to you if done at an OB/GYN office.
- ★ **Set** care gap “alerts” in your electronic medical records (EMR).
- ★ **Document** the month, year, and results of most recent cervical cancer screening in the medical record.
